THE COSTS AND ADVANTAGES OF THE REMARKABLE, BUT NOT EXTRAORDINARY, HUMAN BRAIN AS A SCALED-UP PRIMATE BRAIN

Suzana Herculano

Universidade Federal do Rio de Janeiro, Brasil

The human brain was long thought to be special, an exception to the rules of evolution. But is it really? This talk will compare the cellular makeup of human and other primate brains and reach what should be a non-surprising conclusion: that humans are just another primate species. With some advantages, of course - thanks to a surprising twist that put more calories on our plates and changed our evolutionary history: cooking.
